DETAILED ACTION

Response to Amendment

1. In response to the Amendment received on February 17, 2009, the examiner has carefully considered the amendments.

Response to Arguments

2. Applicant's arguments, see Remarks/Amendments, filed February 17, 2009, with respect to claims 1-13 have been fully considered and are persuasive. The rejection of claims 1-13 under 35 USC 102(e) as being anticipated by or, in the alternative, under 35 USC 103(a) as being unpatentable over Dang et al (204/0102550; 6,869,982; 6,667,395; and 2001/0102582) has been withdrawn. It is deemed that Dang et al does not set forth the instantly claimed composition because the irradiated polybutene-1 differs in both compositions. The polybutene of Dang et al is produced by a different method which results in a different polymer having a different structure being formed. In the method of Dang et al, the polymer polybutene, after irradiation is exposed to two different oxidation steps by exposure to active oxygen under thermal conditions before being held again in an oxygen free environment under thermal conditions for an extended time. As a result the polymers of Dang et al have peroxide radical that have formed under the exposure to active oxygen with the free radical chains formed in the exposure to radiation step. Said peroxide radicals under compounding conditions will form oxygen containing polar groups. The instant polymer produced by the claimed method is not exposed to active oxygen and therefore while being maintained in an oxygen free environment (step 2) the polymers chains will recombine for form long chain branching verses the peroxide radicals in an active oxygen environment.

Allowable Subject Matter

3. Claims 1-13 are allowed.

Art Unit: 1796

4. The following is an examiner's statement of reasons for allowance: The prior art, alone or in combination, fails to teach a composition comprising a mixture of from about 0.05 wt% to about 15 wt% of an irradiate butene-1 polymer material (claims 1, 5, and 8) and from about 85 wt% to about 99.5 wt% of a non-irradiated butene-1 polymer material wherein the irradiated polybutene is exposed to radiation having a total dosage from about 5 to 45 Mrad in an oxygen free environment, holding for a period of 1-8 hours in an oxygen-free environment and then heating in an oxygen free environment in a thermal environment for a period of 2 to 5 hours; wherein said irradiated polybutene material has a melt strength from 1.5 to 40 cN and a Young's Modulus from 100 to 900 MPa. The prior art teaches similar methods however the prior art teaches using irradiated and oxidized polybutene in the composition mixtures. Nor does the prior art, alone or in combination, teach a process for nucleating a non-irradiated butene-1 polymer material comprising the composition and the components as found in instant claim 11.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
